39 **Abstract**

40 The NIST Privacy Framework 1.1 is a voluntary tool developed in collaboration with  
41 stakeholders intended to help organizations identify and manage privacy risk to build  
42 innovative products and services while protecting individuals' privacy. It provides high-level  
43 privacy risk management outcomes that can be used by any organization to better understand,  
44 assess, prioritize, and communicate its privacy activities. This document introduces the Privacy  
45 Framework and privacy risk management practices, highlights the Framework's basic elements,  
46 and offers examples of how it can be used.

47 **Keywords**

48 framework; privacy; privacy framework; privacy risk; privacy risk management; profiles; risk  
49 management; tiers.

## 50 **Note to Reviewers**

51 This NIST Privacy Framework 1.1 Initial Public Draft (IPD) has been developed in response to stakeholder  
52 desire for a Privacy Framework update that:

- 53 • Addresses current privacy risk management needs
- 54 • Realigns with the NIST Cybersecurity Framework (CSF) 2.0
- 55 • Enhances usability

56 NIST seeks stakeholder feedback on whether this IPD meets those goals. NIST also welcomes feedback  
57 on all aspects of the IPD including, but not limited to, content, structure and format, grammar and  
58 syntax, and usability. Please submit clear and actionable suggestions for improvements to this  
59 document, including rationale for each proposed change. Commentators are strongly encouraged to use  
60 the comment template available for download at the NIST Privacy Framework website.

61 In addition to general feedback on the PF 1.1 IPD, NIST is interested in answers to the following  
62 questions:

- 63 • **Implementation Examples:** Should NIST include Privacy Framework 1.1 Implementation  
64 Examples as supplemental material to the PF 1.1 Final Draft?
  - 65 ○ If so, would a mapping of Task Statements from the [NIST Privacy Workforce Taxonomy](#)  
66 to the Privacy Framework 1.1 Core be a useful approach to creating Implementation  
67 Examples? Why or why not?
- 68 • **Gaps in Subcategory Unique Identifiers:** Many Privacy Framework 1.1 IPD Subcategories are  
69 moved to other locations in the Core. This leads to gaps in the Subcategory Unique Identifiers  
70 (e.g., ID.RA-P2 has been withdrawn, creating a gap between ID.RA-P1 and ID.RA-P3).
  - 71 ○ Should NIST re-number Unique Identifiers in the Privacy Framework 1.1. Final Draft to  
72 avoid gaps in numbering?
  - 73 ○ If the answer to the above question is, no, why should NIST retain gaps in Subcategory  
74 Unique Identifiers?
- 75 • **Streamlining the Privacy Framework 1.1 PDF:** The Privacy Framework 1.1 IPD has replaced  
76 Section 3 with a high-level summary of ways to use the Framework. The remaining material has  
77 been moved to the [Privacy Framework website](#), where it is structured for interactive  
78 engagement.
  - 79 ○ Should NIST further streamline the Privacy Framework 1.1 PDF by removing content  
80 from the PDF (e.g., Appendices) and relocating it?
    - 81 ▪ If so, what content should be relocated?
    - 82 ▪ What format or type of materials would best convey the relocated content (e.g.,  
83 Quick Start Guide, interactive online resources, etc.)?

<sup>1</sup> More information on Privacy Framework 1.1 development can be found at <https://www.nist.gov/privacy-framework/new-projects/privacy-framework-version-11>.

## 121 **Executive Summary**

122 For more than two decades, the Internet and associated information technologies have driven  
123 unprecedented innovation, economic value, and improvement in social services. Many of these  
124 benefits are fueled by data about individuals that flow through a complex ecosystem. As a  
125 result, individuals may not realize the potential consequences for their privacy as they interact  
126 with systems, products, and services. At the same time, organizations may not realize the full  
127 extent of these consequences for individuals, for society, or for their enterprises, which can  
128 affect their brands, their finances, and their future prospects for growth.

129 Following a transparent, consensus-based process including both private and public  
130 stakeholders, the National Institute of Standards and Technology (NIST) has updated the  
131 Privacy Framework to Version 1.1 (Privacy Framework 1.1), to meet stakeholder privacy risk  
132 management needs, maintain alignment with the NIST Cybersecurity Framework 2.0  
133 (Cybersecurity Framework or CSF 2.0), and provide information on artificial intelligence (AI) and  
134 privacy risk management. Privacy Framework 1.1 updates include:

- 135 • Targeted revisions and restructuring of the Core
- 136 • A new Section (1.2.2) on AI and privacy risk management
- 137 • Relocation of Section 3 guidelines from front matter to the NIST Privacy Framework  
138 website<sup>2</sup>

139 The Privacy Framework can support organizations in:

- 140 • Building customers' trust by supporting ethical decision-making in product and service  
141 design or deployment that optimizes beneficial uses of data while minimizing adverse  
142 consequences for individuals' privacy and society as a whole;<sup>3</sup>
- 143 • Fulfilling current compliance obligations, as well as future-proofing products and  
144 services to meet these obligations in a changing technological and policy environment;  
145 and
- 146 • Facilitating communication about privacy practices with individuals, business partners,  
147 assessors, and regulators.

148 Deriving benefits from data while simultaneously managing risks to individuals' privacy is not  
149 well-suited to one-size-fits-all solutions. Like building a house, where homeowners make layout  
150 and design choices while relying on a well-engineered foundation, privacy protection should  
151 allow for individual choices, as long as effective privacy risk mitigations are already engineered  
152 into products and services. The Privacy Framework—through a risk- and outcome-based  
153 approach—is flexible enough to address diverse privacy needs, enable more innovative and

---

<sup>2</sup> For more information on using the Privacy Framework 1.1, visit <https://www.nist.gov/privacy-framework/using-privacy-framework-11>.

<sup>3</sup> There is no objective standard for ethical decision-making; it is grounded in the norms, values, and legal expectations in a given society.

154 effective solutions that can lead to better outcomes for individuals and organizations, and stay  
155 current with technology trends.

156 Privacy Framework 1.1 follows the structure of CSF 2.0 [1] to facilitate the use of both  
157 frameworks together. Like the Cybersecurity Framework, the Privacy Framework is composed  
158 of three components: Core, Organizational Profiles, and Tiers. Each component reinforces  
159 privacy risk management through the connection between business and mission drivers,  
160 organizational roles and responsibilities, and privacy protection activities.

- 161 • The Core enables a dialogue—from the executive level to the  
162 implementation/operations level—about important privacy protection activities and  
163 desired outcomes.
- 164 • Organizational Profiles enable the prioritization of the outcomes and activities that best  
165 meet organizational privacy values, mission or business needs, and risks.
- 166 • Tiers support decision-making and communication about the sufficiency of  
167 organizational processes and resources to manage privacy risk.

168 In summary, the Privacy Framework is intended to help organizations build better privacy  
169 foundations by bringing privacy risk into parity with their broader enterprise risk portfolio.

## 170 1. Privacy Framework Introduction

171 For more than two decades, the Internet and associated information technologies have driven  
172 unprecedented innovation, economic value, and access to social services. Many of these  
173 benefits are fueled by *data* about *individuals* that flow through a complex ecosystem. As a result,  
174 individuals may not realize the potential consequences for their privacy as they interact with  
175 systems, products, and services. Organizations may not fully realize the consequences either.  
176 Failure to manage *privacy risks* can have direct adverse consequences at both the individual and  
177 societal levels, with follow-on effects on organizations' brands, bottom lines, and future  
178 prospects for growth. Finding ways to continue to derive benefits from *data processing* while  
179 simultaneously protecting individuals' privacy is challenging, and not well-suited to one-size-  
180 fits-all solutions.

181 Privacy is challenging because not only is it an all-encompassing concept that helps to safeguard  
182 important values such as human autonomy and dignity, but also the means for achieving it can  
183 vary.<sup>4</sup> For example, privacy can be achieved through seclusion, limiting observation, or  
184 individuals' control of facets of their identities (e.g., body, data, reputation).<sup>5</sup> Moreover, human  
185 autonomy and dignity are not fixed, quantifiable constructs; they are filtered through cultural  
186 diversity and individual differences. This broad and shifting nature of privacy makes it difficult  
187 to communicate clearly about privacy risks within and between organizations and with  
188 individuals. What has been missing is a common language and practical tool that is flexible  
189 enough to address various privacy needs.

190 NIST Privacy Framework 1.1 is a voluntary tool, intended to be widely usable by organizations of  
191 all sizes, and agnostic to any particular technology, sector, law, or jurisdiction. Using a common  
192 approach—adaptable to any organization's role(s) in the *data processing ecosystem*—the Privacy  
193 Framework's purpose is to help organizations manage privacy risks by:

- 194 • Taking privacy into account as they design and deploy systems, products, and services  
195 that affect individuals;
- 196 • Communicating about their privacy practices; and
- 197 • Encouraging cross-organizational workforce collaboration—for example, among  
198 executives, legal, and information technology (IT)—through the development of  
199 Profiles, selection of Tiers, and achievement of outcomes.

---

<sup>4</sup> Autonomy and dignity are concepts covered in the United Nations Universal Declaration of Human Rights at <https://www.un.org/en/universal-declaration-human-rights/>.

<sup>5</sup> There are many publications that provide an in-depth treatment on the background of privacy or different aspects of the concept. For two examples, see Solove D (2010) *Understanding Privacy* (Harvard University Press, Cambridge, MA). Available at <https://ssrn.com/abstract=1127888>; and Selinger E, Hartzog W (2017) Obscurity and Privacy, *Spaces for the Future: A Companion to Philosophy of Technology*, eds Pitt J, Shew A (Taylor & Francis, New York, NY), Chapter 12, 1<sup>st</sup> Ed. Available at <https://doi.org/10.4324/9780203735657>.

## 200 1.1. Overview of the Privacy Framework

201 As shown in **Figure 1**, the  
202 Privacy Framework is composed  
203 of three components: Core,  
204 Organizational Profiles, and  
205 Tiers. Each component  
206 reinforces how organizations  
207 manage privacy risk through  
208 the connection between  
209 business or mission drivers,  
210 organizational roles and  
211 responsibilities, and privacy  
212 protection activities. As further  
213 explained in Section 2:

Figure 1: Core, Organizational Profiles, and Tiers

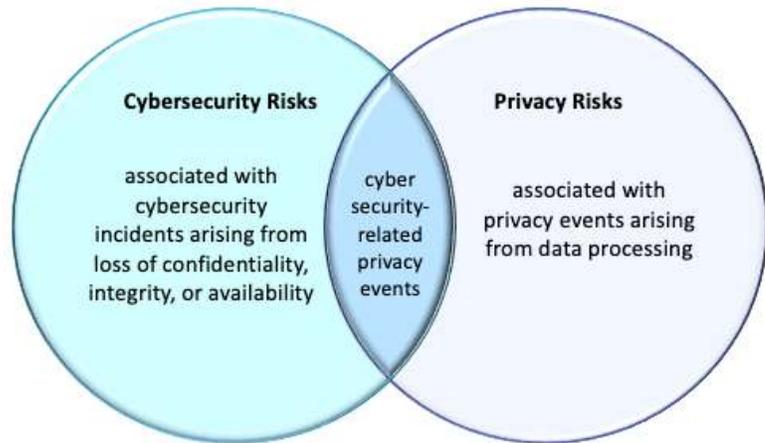

- 214 • The *Core* is a set of  
215 privacy protection  
216 activities and outcomes  
217 that allows for  
218 communicating  
219 prioritized privacy protection activities and outcomes across an organization from the  
220 executive level to the implementation/operations level. The Core is further divided into  
221 key Categories and Subcategories—which are discrete outcomes—for each Function.
- 222 • An Organizational *Profile* represents an organization’s current privacy activities or  
223 desired outcomes. Groups of organizations can also create Community Profiles to  
224 address shared privacy risk management needs and priorities. To develop a Profile, an  
225 organization can review all the outcomes and activities in the Core to determine which  
226 are most important to focus on based on business or mission drivers, data processing  
227 ecosystem role(s), types of data processing, and individuals’ privacy needs. An  
228 organization can create or add Functions, Categories, and Subcategories as needed.  
229 Profiles can be used to identify opportunities for improving privacy posture by  
230 comparing a “Current” Profile (the “as is” state) with a “Target” Profile (the “to be”  
231 state). Profiles can be used to conduct self-assessments and to communicate within an  
232 organization or between organizations about how privacy risks are being managed.
- 233 • *Tiers* provide a point of reference on how an organization views privacy risk and whether  
234 it has sufficient processes and resources in place to manage that risk. Tiers reflect a  
235 progression from informal, reactive responses to approaches that are agile and risk  
236 informed. When selecting Tiers, an organization should consider its Target Profile(s) and  
237 how achievement may be supported or hampered by factors such as its current risk  
238 management practices, the degree of integration of privacy risk into its enterprise risk  
239 management portfolio, its data processing ecosystem relationships, and its workforce  
240 composition and training program.

## 241 1.2. Privacy Risk Management

242 To promote broader understanding of *privacy risk management*, this section covers concepts  
243 and considerations that organizations may use to develop, improve, or communicate about  
244 privacy risk management. Appendix D provides additional information on key privacy risk  
245 management practices.

### 246 1.2.1. Cybersecurity and Privacy Risk Management

247 Since its release in 2014, the  
248 Cybersecurity Framework has  
249 helped organizations to  
250 communicate and manage  
251 cybersecurity risk. [1] While  
252 managing cybersecurity risk  
253 contributes to managing privacy  
254 risk, it is not sufficient, as privacy  
255 risks can also arise by means  
256 unrelated to *cybersecurity incidents*,  
257 as illustrated by **Figure 2**. Having a  
258 general understanding of the  
259 different origins of cybersecurity  
260 and privacy risks is important for  
261 determining the most effective solutions

262 **Figure 2: Cybersecurity and Privacy Risk Relationship**

262 to address the risks.

**Data Action**  
A data life cycle operation, including, but not limited to collection, retention, logging, generation, transformation, use, disclosure, sharing, transmission, and disposal.

**Data Processing**  
The collective set of data actions.

274

The Privacy Framework approach to privacy risk is to consider *privacy events* as potential problems individuals could experience arising from system, product, or service operations with data, whether in digital or non-digital form, through a complete life cycle from data collection through disposal.

The Privacy Framework describes these data operations in the singular as a *data action* and collectively as data processing. The problems individuals can experience as a result of data processing can be expressed in various ways, but NIST describes them as ranging from dignity-type effects such as embarrassment or stigmas to more tangible harms such as discrimination, economic loss, or physical harm.<sup>6</sup>

275 The basis for the problems that individuals may experience can vary. As depicted in **Figure 2**,  
276 problems arise as an adverse effect of data processing that organizations conduct to meet their

---

<sup>6</sup> NIST has created an illustrative catalog of problems for use in privacy risk assessment. See *NIST Privacy Risk Assessment Methodology* [2]. Other organizations may have created other categories of problems, or may refer to them as adverse consequences or harms.

277 mission or business objectives. An example is the concerns that certain communities had about  
278 the installation of “smart meters” as part of the Smart Grid, a nationwide technological effort to  
279 increase energy efficiency.<sup>7</sup> The ability of these meters to collect, record, and distribute highly  
280 granular information about household electrical use could provide insight into people’s  
281 behavior inside their homes.<sup>8</sup> The meters were operating as intended, but the data processing  
282 could lead to people feeling surveilled.

283 In an increasingly connected world, some problems can arise simply from individuals’  
284 interactions with systems, products, and services, even when the data being processed is not  
285 directly linked to identifiable individuals. For example, smart cities technologies could be used  
286 to alter or influence people’s behavior such as where or how they move through the city.<sup>9</sup>  
287 Problems also can arise where there is a loss of *confidentiality*, *integrity*, or *availability* at some  
288 point in the data processing, such as data theft by external attackers or the unauthorized access  
289 or use of data by employees. **Figure 2** shows these types of cybersecurity-related privacy events  
290 as the overlap between privacy and cybersecurity risks.

291 Once an organization can identify the likelihood of any given problem arising from the data  
292 processing, which the Privacy Framework refers to as a *problematic data action*, it can assess the  
293 impact should the problematic data action occur. This impact assessment is where privacy risk  
294 and organizational *risk* intersect. Individuals, whether singly or in groups (including at a societal  
295 level) experience the direct impact of problems. As a result of the problems individuals  
296 experience, an organization may experience impacts such as noncompliance costs, revenue loss  
297 arising from customer abandonment of products and services, or harm to its external brand  
298 reputation or internal culture. Organizations commonly manage these types of impacts through  
299 enterprise risk management (ERM); by connecting problems that individuals experience to  
300 these well-understood organizational impacts, organizations can bring privacy risk into parity  
301 with other risks they are managing in their broader portfolio and drive more informed decision-  
302 making about resource allocation to strengthen privacy programs. **Figure 3** illustrates this  
303 relationship between privacy risk and enterprise risk.<sup>10</sup>

<sup>7</sup> See, for example, NIST Interagency or Internal Report (IR) 7628 Revision 1 Volume 1, Guidelines for Smart Grid Cybersecurity: Volume 1 – Smart Grid Cybersecurity Strategy, Architecture, and High-Level Requirements at [3] p. 26.

<sup>8</sup> See NIST IR 8062, *An Introduction to Privacy Engineering and Risk Management in Federal Systems* at [4] p. 2. For additional types of privacy risks associated with adverse effects on individuals of data processing, see Appendix E of NIST IR 8062.

<sup>9</sup> See Newcombe T (2016) Security, Privacy, Governance Concerns About Smart City Technologies Grow. *Government Technology*. Available at <http://www.govtech.com/Security-Privacy-Governance-Concerns-About-Smart-City-Technologies-Grow.html>.

<sup>10</sup> See NIST SP 800-221, *Enterprise Impact of Information and Communications Technology Risk, Governing and Managing ICT Risk Programs Within an Enterprise Risk Portfolio* at [5] for more information on enterprise risk.

304

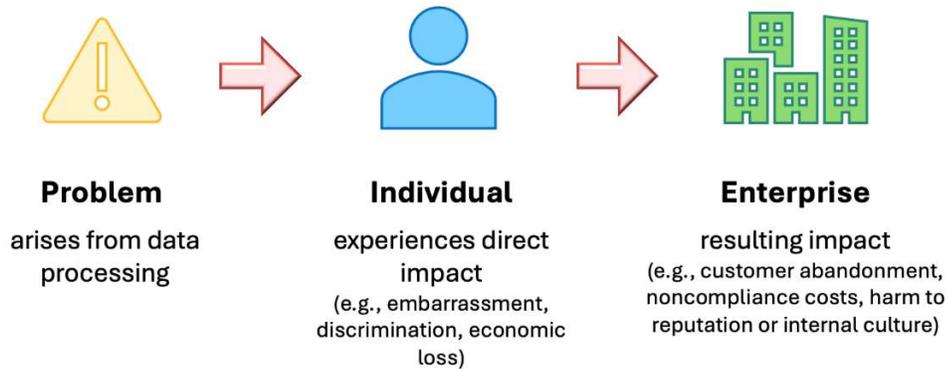

Figure 3: Relationship Between Privacy Risk and Enterprise Risk

305

### 306 1.2.2. Artificial Intelligence and Privacy Risk Management

307 Artificial intelligence (AI) systems are engineered or machine-based systems that can, for a  
308 given set of objectives, generate outputs such as predictions, recommendations, or decisions  
309 influencing real or virtual environments. As a tool designed for all technologies, Privacy  
310 Framework 1.1 can assist organizations with identifying and managing privacy risks that can  
311 arise from data processing within AI systems throughout the AI lifecycle. Privacy risks can arise,  
312 for example, when AI systems are trained on data that was collected without individuals'  
313 consent or have missing or inadequate privacy safeguards.<sup>11</sup> An AI system could also reveal  
314 information about individuals by estimating individuals' personal attributes or through privacy  
315 attacks such as data reconstruction, prompt injection, or membership inference. This may  
316 create privacy problems ranging from embarrassment and stigmatization to unanticipated  
317 revelation. Systemic, computational and statistical, as well as human-cognitive biases can exist  
318 and persist in AI systems that make important decisions and predictions about people.<sup>12</sup> In  
319 some cases, AI technology may be the key enabler of privacy risk (e.g., use of generative AI to  
320 create privacy-invasive images, video, or audio). These and other data processing activities  
321 within AI systems may create privacy problems for individuals and groups, including at a  
322 societal level, ranging from dignity effects to more concrete harms like physical harm and  
323 economic loss. As discussed in Section 1.2.1 above, these impacts on the privacy of individuals  
324 and groups can lead to significant organizational impacts, ranging from revenue losses to  
325 reputational harms.

<sup>11</sup> Numerous publications analyze and characterize AI privacy risks. See, for example, Lee H, Yang Y, von Davier TS, Forlizzi J, Das S (2024) Deepfakes, Phrenology, Surveillance, and More! A Taxonomy of AI Privacy Risks. (Carnegie Mellon University, Pittsburgh PA, United States). Available at <https://dl.acm.org/doi/pdf/10.1145/3613904.3642116>; and Solove DJ (2024) Artificial Intelligence and Privacy. 77 Florida Law Review, GWU Legal Studies Research Paper No. 2024-36, GWU Law School Public Law Research Paper No. 2024-36. Available at [https://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=4713111](https://papers.ssrn.com/sol3/papers.cfm?abstract_id=4713111).

<sup>12</sup> For further discussion of bias in Artificial Intelligence, see Schwartz R, Vassilev A, Greene K, Perine L, Burt A, Hall P (2022) Towards a Standard for Identifying and Managing Bias in Artificial Intelligence. (National Institute of Standards and Technology, Gaithersburg, MD), NIST Special Publication 1270. Available at <https://nvlpubs.nist.gov/nistpubs/SpecialPublications/NIST.SP.1270.pdf>

326 Organizations can utilize the Privacy Framework 1.1 Core to identify and prioritize outcomes to  
327 effectively manage AI privacy risks and ensure that organizational privacy values are reflected in  
328 the development and use of AI systems. For example, organizations can leverage the new Roles,  
329 Responsibilities, and Authorities Category (GV.RR-P) to ensure roles and responsibilities for the  
330 AI workforce are established with respect to privacy to foster accountability and continuous  
331 improvement. Organizations can also prioritize outcomes in the Monitoring and Review  
332 Category (GV.MT-P) for regularly reviewing and updating policies to respond to emerging and  
333 rapidly evolving AI privacy risks. The Control-P and Communicate-P Functions can be utilized to  
334 consider how technical measures like de-identification techniques as well as mechanisms for  
335 enabling individuals' data processing preferences can meet an organization's identified AI  
336 privacy priorities like data minimization or user control over how their data are used in AI  
337 systems.

338 Managing privacy risks associated with AI can make AI systems more trustworthy and support  
339 responsible AI practices. AI risks, however, go beyond privacy risks to implicate other risks such  
340 as cybersecurity. The relationship between AI and privacy risk is complex, and AI risk may affect  
341 privacy risk differently depending on the specific use case and context. This poses challenges for  
342 managing AI and privacy risks together. For example, differentially private synthetic data could  
343 be used to train machine learning models while enhancing the privacy protections for the  
344 original data. Yet, the synthetic generation process may skew distributions and introduce other  
345 biases, which can propagate to downstream applications.

346 The NIST AI Risk Management Framework (AI RMF) can help organizations manage AI risks and  
347 promote trustworthy and responsible development and use of AI systems.<sup>13</sup> The AI RMF can be  
348 used with Privacy Framework 1.1 as well as other NIST risk management frameworks such as  
349 CSF 2.0. Treating AI risks together with other enterprise risks (e.g., privacy, cybersecurity)  
350 supports integrated outcomes and organizational efficiencies. NIST also develops integrated  
351 NIST frameworks Community Profiles to assist organizations seeking to effectively use NIST  
352 frameworks together and to understand and manage the complex relationship and  
353 dependencies among AI and other risks.<sup>14</sup>

### 354 1.2.3. Privacy Risk Assessment

355 Privacy risk management is a cross-organizational set of processes that helps organizations to  
356 understand how their systems, products, and services may create problems for individuals and  
357 how to develop effective solutions to manage such risks. *Privacy risk assessment* is a sub-process  
358 for identifying and analyzing specific privacy risks. In general, privacy risk assessments produce  
359 the information that can help organizations to weigh the benefits of the data processing against  
360 the risks and to determine the appropriate response—sometimes referred to as

---

<sup>13</sup> See NIST Artificial Intelligence (AI) Risk Management Framework (AI RMF 1.0), NIST AI 100-1 at [6].

<sup>14</sup> See, e.g., NIST Data Governance and Management Profile. Available at <https://www.nist.gov/privacy-framework/new-projects/data-governance-and-management-profile>.

361 proportionality.<sup>15</sup> Organizations may choose to prioritize and respond to privacy risk in different  
362 ways, depending on the potential impact to individuals and resulting impacts to organizations.  
363 Response approaches include:<sup>16 17</sup>

- 364 • Mitigating the risk (e.g., organizations may be able to apply technical and/or policy  
365 measures to the systems, products, or services that minimize the risk to an acceptable  
366 degree);
- 367 • Transferring or sharing the risk (e.g., contracts are a means of sharing or transferring risk  
368 to other organizations, privacy notices and consent mechanisms are a means of sharing  
369 risk with individuals);
- 370 • Avoiding the risk (e.g., organizations may determine that the risks outweigh the  
371 benefits, and forego or terminate the data processing); or
- 372 • Accepting the risk (e.g., organizations may determine that problems for individuals are  
373 minimal or unlikely to occur, therefore the benefits outweigh the risks, and it is not  
374 necessary to invest resources in mitigation).

375 Privacy risk assessments are particularly important because, as noted above, privacy is a  
376 condition that safeguards multiple values. The methods for safeguarding these values may  
377 differ, and moreover, may be in tension with each other. Depending on its objectives, if an  
378 organization is trying to achieve privacy by limiting observation, this may lead to implementing  
379 measures such as distributed data architectures or privacy-enhancing cryptographic techniques  
380 that hide data even from the organization. If an organization is also trying to enable individual  
381 control, the measures could conflict. For example, if an individual requests access to data, the  
382 organization may not be able to produce the data if the data have been distributed or  
383 encrypted in ways the organization cannot access. Privacy risk assessments can help an  
384 organization understand in a given context the values to protect, the methods to employ, and  
385 how to balance implementation of different types of measures.

386 Lastly, privacy risk assessments help organizations distinguish between privacy risk and  
387 compliance risk. Identifying if data processing could create problems for individuals, even when  
388 an organization may be fully compliant with applicable laws or regulations, can help with ethical  
389 decision-making in system, product, and service design or deployment. Although there is no  
390 objective standard for ethical decision-making, it is grounded in the norms, values, and legal  
391 expectations in a given society. This facilitates optimizing beneficial uses of data while  
392 minimizing adverse consequences for individuals' privacy and society as a whole, as well as  
393 avoiding losses of trust that damage organizations' reputations, slow adoption, or cause  
394 abandonment of products and services.

---

<sup>15</sup> See European Data Protection Supervisor (2019) Necessity & Proportionality. Available at [https://edps.europa.eu/data-protection/our-work/subjects/necessity-proportionality\\_en](https://edps.europa.eu/data-protection/our-work/subjects/necessity-proportionality_en).

<sup>16</sup> See NIST Special Publication 800-39, *Managing Information Security Risk: Organization, Mission, and Information System View* [7].

<sup>17</sup> Where positive risks (i.e., opportunities) are to be considered, such as for setting enterprise risk appetite and tolerance, there are four generally used response types: realize, share, enhance, and accept. For more information on considerations of positive risks as an input to ERM, see NIST Special Publication 800-221, *Enterprise Impact of Information and Communications Technology Risk: Governing and Managing ICT Risk Programs Within an Enterprise Risk Portfolio* at [5] p. 35–37.

395 See Appendix D for more information on the operational aspects of privacy risk assessment.

### 396 1.3. Document Overview

397 The remainder of this document contains the following sections and appendices:

- 398 • **Section 2** describes the Privacy Framework components: Core, Profiles, and  
399 Implementation Tiers.
- 400 • **Section 3** presents examples of how the Privacy Framework can be used.
- 401 • The **References section** lists the references for the document.
- 402 • **Appendix A** presents the Privacy Framework Core in a tabular format: Functions,  
403 Categories, and Subcategories.
- 404 • **Appendix B** contains a glossary of selected terms.
- 405 • **Appendix C** lists acronyms used in this document.
- 406 • **Appendix D** considers key practices that contribute to successful privacy risk  
407 management.

## 408 2. Privacy Framework Basics

409 The Privacy Framework provides a common language for understanding, managing, and  
410 communicating privacy risk with internal and external stakeholders. It is adaptable to any  
411 organization’s role(s) in the data processing ecosystem. It can be used to help identify and  
412 prioritize actions for reducing privacy risk, and it is a tool for aligning policy, business, and  
413 technological approaches to managing that risk.

### 414 2.1. Core

415 Set forth in Appendix A, the Core  
416 provides an increasingly granular set  
417 of activities and outcomes that enable  
418 a dialogue about managing privacy  
419 risk. As depicted in **Figure 4**, the Core  
420 comprises Functions, Categories, and  
421 Subcategories.

422 The Core elements work together:

- 423 • *Functions* organize  
424 foundational privacy activities  
425 at their highest level. They aid  
426 an organization in expressing  
427 its management of privacy risk by understanding and managing data processing,  
428 enabling risk management decisions, determining how to interact with individuals, and  
429 improving by learning from previous activities. They are not intended to form a serial  
430 path or lead to a static desired end state. Rather, the Functions should be performed  
431 concurrently and continuously to form or enhance an operational culture that addresses  
432 the dynamic nature of privacy risk.
- 433 • *Categories* are the subdivisions of a Function into groups of privacy outcomes closely  
434 tied to programmatic needs and particular activities.
- 435 • *Subcategories* further divide a Category into specific outcomes of technical and/or  
436 management activities. They provide a set of results that, while not exhaustive, help  
437 support achievement of the outcomes in each Category.

438 The five Functions, Identify-P, Govern-P, Control-P, Communicate-P, and Protect-P, defined  
439 below, can be used to manage privacy risks arising from data processing.<sup>18</sup> Protect-P is  
440 specifically focused on managing risks associated with cybersecurity-related privacy events  
441 (e.g., *privacy breaches*). CSF 2.0, although intended to cover all types of cybersecurity incidents,  
442 can be leveraged to further support the management of risks associated with cybersecurity-  
443 related privacy events by using the Govern, Detect, Respond, and Recover Functions.

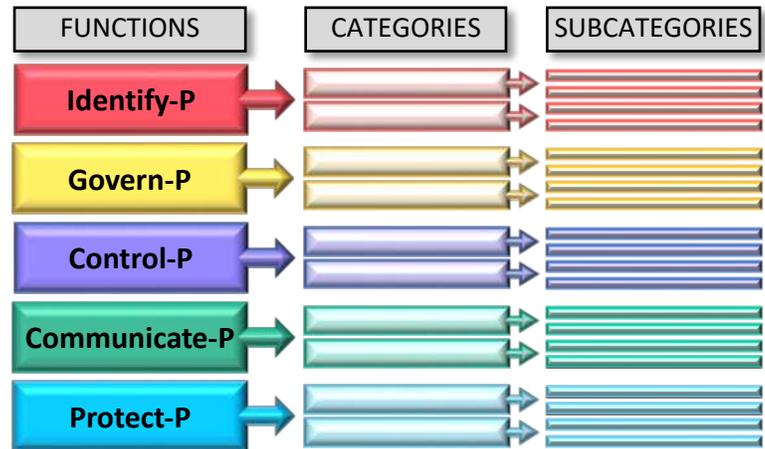

Figure 4: Privacy Framework Core Structure

<sup>18</sup> The “-P” at the end of each Function name indicates that it is from the Privacy Framework in order to avoid confusion with Cybersecurity Framework Functions.

444 Alternatively, organizations may use all six CSF 2.0 Functions in conjunction with Identify-P,  
445 Govern-P, Control-P, and Communicate-P to collectively address privacy and cybersecurity risks.  
446 The five Privacy Framework Functions are defined as follows:

- 447 • *Identify-P* – Develop the organizational understanding to manage privacy risk for  
448 individuals arising from data processing.

449 The activities in the Identify-P Function are foundational for effective use of the Privacy  
450 Framework. Inventorying the circumstances under which data are processed,  
451 understanding the privacy interests of individuals directly or indirectly served or  
452 affected by an organization, and conducting risk assessments enable an organization to  
453 understand the business environment in which it is operating and identify and prioritize  
454 privacy risks.

- 455 • *Govern-P* – Develop and implement the organizational governance structure to enable an  
456 ongoing understanding of the organization’s risk management priorities that  
457 are informed by privacy risk.

458 The Govern-P Function is similarly foundational, but focuses on organizational-level activities  
459 such as establishing organizational privacy values and policies, identifying legal/regulatory  
460 requirements, and understanding organizational *risk tolerance* that enable an organization to  
461 focus and prioritize its efforts, consistent with its risk management strategy and business needs.

- 462 • *Control-P* – Develop and implement appropriate activities to enable organizations or  
463 individuals to manage data with sufficient granularity to manage privacy risks.

464 The Control-P Function considers data processing management from the standpoint of  
465 both organizations and individuals.

- 466 • *Communicate-P* – Develop and implement appropriate activities to enable organizations  
467 and individuals to have a reliable understanding and engage in a dialogue about how  
468 data are processed and associated privacy risks.

469 The Communicate-P Function recognizes that both organizations and individuals may  
470 need to know how data are processed in order to manage privacy risk effectively.

- 471 • *Protect-P* – Develop and implement appropriate data processing safeguards.

472 The Protect-P Function covers data protection to prevent cybersecurity-related privacy  
473 events, the overlap between privacy and cybersecurity risk management.

## 474 2.2. Profiles

475 Profiles are a selection of specific Functions, Categories, and Subcategories from the Core that  
476 an organization has prioritized to help it manage privacy risk. Profiles can be used to describe  
477 the current state and the desired target state of specific privacy activities. A Current Profile  
478 indicates privacy outcomes that an organization is currently achieving, while a Target Profile  
479 indicates the outcomes needed to achieve the desired privacy risk management goals. The  
480 differences between the two Profiles enable an organization to identify gaps, develop an action  
481 plan for improvement, and gauge the resources that would be needed (e.g., staffing, funding)  
482 to achieve privacy outcomes. This  
483 forms the basis of an organization's  
484 plan for reducing privacy risk in a  
485 cost-effective, prioritized manner.  
486 Profiles also can aid in  
487 communicating risk within and  
488 between organizations by helping  
489 organizations understand and  
490 compare the current and desired  
491 state of privacy outcomes.

492 The Privacy Framework does not  
493 prescribe Profile templates to allow  
494 for flexibility in implementation.  
495 When creating Profiles,  
496 organizations may include  
497 additional categories of  
498 information to support achievement of their prioritized outcomes and activities. Examples of  
499 these categories of information include:

- 500 • Priority level
- 501 • Status
- 502 • Associated policies, processes, and procedures
- 503 • Roles and responsibilities
- 504 • Informative references (e.g., [NIST Privacy Workforce Taxonomy](https://www.nist.gov/privacy-framework/workforce-advancement/privacy-workforce-taxonomy))<sup>19</sup>

505 Under the Privacy Framework's risk-based approach, organizations may not need to achieve  
506 every outcome or activity reflected in the Core. When developing a Profile, an organization may  
507 select or tailor the Functions, Categories, and Subcategories to its specific needs, including  
508 developing its own additional Functions, Categories, and Subcategories to account for unique

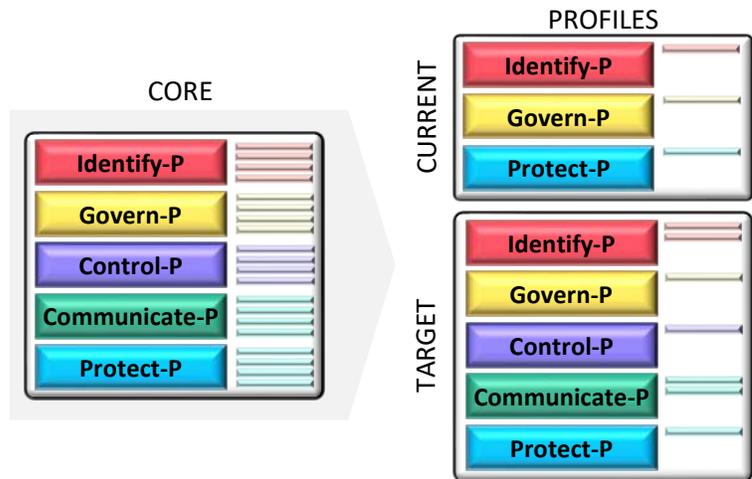

Figure 5: Relationship Between Core and Profiles

<sup>19</sup> The NIST Privacy Workforce Taxonomy is a set of Task, Knowledge, and Skill Statements aligned with the NIST Privacy Framework and the [NICE Workforce Framework](https://www.nist.gov/privacy-framework/workforce-advancement/privacy-workforce-taxonomy). The Privacy Workforce Taxonomy can help organizations better achieve their desired privacy outcomes, support recruitment with more consistent position descriptions, and inform the education and training of professionals to produce a workforce capable of managing privacy risk. More information is available at <https://www.nist.gov/privacy-framework/workforce-advancement/privacy-workforce-taxonomy>.

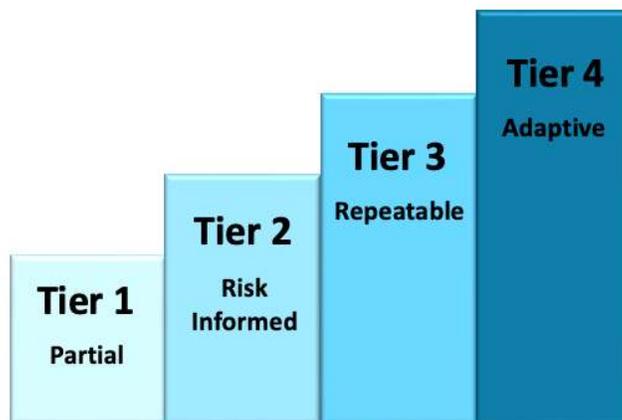

509 organizational risks. An organization determines these needs by considering its mission or  
510 business objectives, privacy values, and risk tolerance; role(s) in the data processing ecosystem  
511 or industry sector; legal/regulatory requirements and industry best practices; risk management  
512 priorities and resources; and the privacy needs of individuals who are directly or indirectly  
513 served or affected by an organization’s systems, products, or services.

514 As illustrated in **Figure 6**, there is no specified order of development of Profiles. An organization  
515 may first develop a Target Profile to focus on its desired outcomes for privacy and then develop  
516 a Current Profile to identify gaps. Alternatively, an organization may begin by identifying its  
517 current activities and then consider how to adjust these activities for its Target Profile. An  
518 organization may choose to develop multiple Profiles for different roles, systems, products, or  
519 services, or categories of individuals (e.g., employees, customers) to enable better prioritization  
520 of activities and outcomes where there may be differing degrees of privacy risk.

521 Organizations in a certain industry sector or with similar roles in the data processing ecosystem  
522 may coordinate to develop Community Profiles to address shared interests and goals.<sup>20</sup> An  
523 organization can use a Community Profile as a basis for its own organizational Profile. The  
524 National Cybersecurity Center of Excellence (NCCoE) offers numerous resources to support  
525 organizations seeking to utilize existing Community Profiles or to develop their own Community  
526 Profile(s). These resources can be found at <https://www.nccoe.nist.gov/>.

### 527 2.3. Tiers

528 Tiers support organizational decision-making about how to manage privacy risk by considering  
529 the nature of the privacy risks engendered by an organization’s systems, products, or services  
530 and the sufficiency of the processes and resources an organization has in place to manage such  
531 risks. As illustrated in Figure 6 below, there are four distinct Tiers, Partial (Tier 1), Risk Informed  
532 (Tier 2), Repeatable (Tier 3), and Adaptive (Tier 4). Tiers are described in more detail in  
533 Appendix E.

542 **Figure 6: Privacy Framework Tiers**

---

<sup>20</sup> More information on CSF Community Profiles can be found at <https://www.nist.gov/cyberframework/profiles>.

543 When selecting Tiers, an organization should consider:

- 544 • Its Target Profile(s) and how achievement may be supported or hampered by its current  
545 risk management practices
- 546 • The degree of integration of privacy risk into its enterprise risk management portfolio
- 547 • Its data processing ecosystem relationships
- 548 • Its workforce composition and training program.

549 The Tiers represent a progression, but progression is not required. Although organizations at  
550 Tier 1 will likely benefit from moving to Tier 2, not all organizations need to achieve Tiers 3 or 4  
551 (or may only focus on certain areas of these Tiers). Progression to higher Tiers is appropriate  
552 when an organization's processes or resources at its current Tier may be insufficient to help it  
553 manage its privacy risks.

554 An organization can use the Tiers to communicate internally about resource allocations  
555 necessary to progress to a higher Tier or as general benchmarks to gauge progress in its  
556 capability to manage privacy risks. An organization can also use Tiers to understand the scale of  
557 resources and processes of other organizations in the data processing ecosystem and how they  
558 align with the organization's privacy risk management priorities. Nonetheless, successful  
559 implementation of the Privacy Framework is based upon achieving the outcomes described in  
560 an organization's Target Profile(s) and not upon Tier determination.

### 561 3. How to Use the Privacy Framework

562 When used as a risk management tool, the Privacy Framework can assist an organization in its  
563 efforts to optimize beneficial uses of data and develop innovative systems, products, and  
564 services while minimizing adverse consequences for individuals. The Privacy Framework can  
565 help organizations answer the fundamental question, “How are we considering the privacy  
566 impacts to individuals and groups as we develop our systems, products, and services?” To  
567 account for the unique needs of an organization, use of the Privacy Framework is flexible,  
568 although it is designed to complement existing business and system development operations.  
569 Privacy Framework 1.1 may be used in many ways. For example, an organization may already  
570 have robust privacy risk management processes, but it may use the Core’s five Functions as a  
571 streamlined way to analyze gaps and articulate privacy program needs with leadership and  
572 decision-makers. Alternatively, an organization seeking to establish a privacy program can use  
573 the Core’s Categories and Subcategories as a reference. Other organizations may compare  
574 Profiles or Tiers to align privacy risk management priorities across different roles in the data  
575 processing ecosystem.

576 The variety of ways in which the Privacy Framework can be used by organizations should  
577 discourage the notion of “compliance with the Privacy Framework” as a uniform or externally  
578 referenceable concept. A few example options for use of the Privacy Framework are as follows:

- 579 • **Using with Informative References.** Informative References, such as those found in the  
580 Privacy Framework online [Resource Repository](#) and [National Online Informative](#)  
581 [Reference Program](#), support Privacy Framework 1.1 use by mapping to the Privacy  
582 Framework Core. Informative References include crosswalks, Profiles, guidelines, and  
583 tools.
- 584 • **Strengthening Accountability.** Privacy Framework 1.1 supports collaboration and  
585 communication across an organization, from senior executives to business/process  
586 managers to the implementation/operations level.
- 587 • **Establishing or improving a privacy program.** Privacy Framework 1.1 can support the  
588 creation of a new privacy program or improvement of an existing program.
- 589 • **Applying to the system development life cycle.** A Privacy Framework 1.1 Target Profile  
590 can be aligned with the system development life cycle phases (e.g., plan, design, deploy,  
591 decommission) to support achievement of prioritized privacy outcomes.
- 592 • **Using within the data processing ecosystem.** By developing one or more Privacy  
593 Framework 1.1 Profiles relevant to its role(s) in the data processing ecosystem, an  
594 organization can consider how its privacy risk management practices affect other data  
595 processing ecosystem entities’ management of privacy risk.
- 596 • **Informing Buying Decisions.** A Privacy Framework 1.1 Profile can be used to generate a  
597 prioritized list of privacy requirements

598 For more details on how to use Privacy Framework 1.1, please visit the [“Using Privacy](#)  
599 [Framework 1.1”](#) webpage. Informative References, informational videos, and the Privacy  
600 Framework Quick Start Guide, can also be found at the Privacy Framework [Learning Center](#).

## 661 **Appendix A. Privacy Framework Core**

662 This appendix presents the Core: a table of Functions, Categories, and Subcategories that  
663 describe specific activities and outcomes that can support managing privacy risks when  
664 systems, products, and services are processing data.

### 665 [Note to Users](#)

#### 666 **Risk-based Approach:**

- 667 • **The Core is not a checklist of actions to perform. An organization selects Functions,**  
668 **Categories, and Subcategories consistent with its risk strategy to protect individuals’**  
669 **privacy.** An organization may not need to achieve every outcome or activity reflected in  
670 the Core. It is expected that an organization will use Profiles to select and prioritize the  
671 Functions, Categories, and Subcategories that best meet its specific needs by  
672 considering its goals, role(s) in the data processing ecosystem or industry sector,  
673 legal/regulatory requirements and industry best practices, risk management priorities,  
674 and the privacy needs of individuals who are directly or indirectly served or affected by  
675 an organization’s systems, products, or services.
- 676 • **It is not obligatory to achieve a Core outcome in its entirety.** An organization may use  
677 its Profiles to express partial achievement of an outcome, as not all aspects of an  
678 outcome may be relevant for it to manage privacy risk. An organization may also use a  
679 Target Profile to express an aspect of an outcome that it does not currently have the  
680 capability to achieve.
- 681 • **It may be necessary to consider multiple Core outcomes in combination to**  
682 **appropriately manage privacy risk.** For example, an organization that responds to  
683 individuals’ requests for data access may select for its Profile both the Subcategory  
684 CT.DM-P1: “Data elements can be accessed for review” and the Category “Identity  
685 Management, Authentication, and Access Control” (PR.AC-P) to ensure that only the  
686 individual to whom the data pertain gets access.

#### 687 **Implementation:**

- 688 • **The tabular format of the Core is not intended to suggest a specific implementation**  
689 **order or imply a degree of importance between the Functions, Categories, and**  
690 **Subcategories.** Implementation may be nonsequential, simultaneous, or iterative,  
691 depending on the SDLC stage, status of the privacy program, scale of the workforce, or  
692 role(s) of an organization in the data processing ecosystem.
- 693 • **The Core is not exhaustive.** The Core is extensible, allowing organizations, sectors, and  
694 other entities to adapt or add additional Functions, Categories, and Subcategories to  
695 their Profiles.

#### 696 **Roles:**

- 697 • **Ecosystem Roles:** The Core is intended to be usable by any organization or entity  
698 regardless of its role(s) in the data processing ecosystem. Although the Privacy

699 Framework does not classify ecosystem roles, an organization should review the Core  
700 from its standpoint in the ecosystem. An organization’s role(s) may be legally codified—  
701 for example, some laws classify organizations as data controllers or data processors—or  
702 classifications may be derived from industry designations. Since Core elements are not  
703 assigned by ecosystem role, an organization can use its Profiles to select Functions,  
704 Categories, and Subcategories that are relevant to its role(s).

705 • **Organizational Roles:** Different parts of an organization’s workforce may take  
706 responsibility for different Categories or Subcategories. For example, the legal  
707 department may be responsible for carrying out activities under “Governance Policies,  
708 Processes, and Procedures” while the IT department is working on “Inventory and  
709 Mapping.” Ideally, the Core encourages cross- organization collaboration to develop  
710 Profiles and achieve outcomes.

711 **Scalability:** Certain aspects of outcomes may be ambiguously worded. For example, outcomes  
712 may include terms like “communicated” or “disclosed” without stating to whom the  
713 communications or disclosures are being made. The ambiguity is intentional to allow for a wide  
714 range of organizations with different use cases to determine what is appropriate or required in  
715 a given context.

716 **Online Resource Repository:** Standalone resources that can provide more information on how  
717 to prioritize or achieve outcomes can be found at <https://www.nist.gov/privacy-framework>.

718 **Cybersecurity Framework Alignment:**

719 • The Privacy Framework 1.1 update maintains alignment with CSF 2.0 wherever possible,  
720 while also addressing organizations’ unique privacy needs. In order to achieve this, some  
721 Privacy Framework 1.0 Categories and Subcategories have been withdrawn or relocated.  
722 These changes are noted in **Table 2** where applicable.

723 • Certain Functions, Categories, or Subcategories may be identical to or have been  
724 adapted from the Cybersecurity Framework. The following legend can be used to  
725 identify this relationship in **Table 2**.

The Function, Category, or Subcategory aligns with the Cybersecurity Framework, but the text has been adapted for the Privacy Framework.

The Category or Subcategory is identical to the Cybersecurity Framework.

726  
727 • A complete crosswalk between Privacy Framework 1.1 and CSF 2.0 can be found in the  
728 resource repository at <https://www.nist.gov/privacy-framework/resource-repository>.

729 **Core Identifiers:** For ease of use, each component of the Core is given a unique identifier.  
730 Functions and Categories each have a unique alphabetic identifier, as shown in **Table 1**.  
731 Subcategories within each Category have a number added to the alphabetic identifier; the  
732 unique identifier for each Subcategory is included in **Table 2**.

733

**Table 1: Privacy Framework 1.1 Function and Category Unique Identifiers**

734

Function Unique Identifier	Function	Category Unique Identifier	Category
ID-P	Identify-P	ID.IM-P	Inventory and Mapping
		ID.BE-P	Business Environment
		ID.RA-P	Risk Assessment
GV-P	Govern-P	GV.PO-P	Governance Policies, Processes, and Procedures
		GV.RM-P	Risk Management Strategy
		GV.OV-P	Oversight
		GV.RR-P	Roles, Responsibilities, and Authorities
		GV.DE-P	Data Processing Ecosystem Risk Management
		GV.AT-P	Awareness and Training
		GV.MT-P	Monitoring and Review
CT-P	Control-P	CT.PO-P	Data Processing Policies, Processes, and Procedures
		CT.DM-P	Data Processing Management
		CT.DP-P	Disassociated Processing
CM-P	Communicate-P	CM.PO-P	Communication Policies, Processes, and Procedures
		CM.AW-P	Data Processing Awareness
PR-P	Protect-P	PR.PO-P	Data Protection Policies, Processes, and Procedures
		PR.AA-P	Identity Management, Authentication, and Access Control
		PR.DS-P	Data Security
		PR.PS-P	Platform Security
		PR.IR-P	Technology Infrastructure Resilience

735

**Table 2: Privacy Framework Core**

Function	Category	Subcategory
<p><b>IDENTIFY-P (ID-P):</b> Develop the organizational understanding to manage privacy risk for individuals arising from data processing.</p>	<p><b>Inventory and Mapping (ID.IM-P):</b> <a href="#">Data processing</a> by systems, products, or services is understood and informs the management of <a href="#">privacy risk</a>.</p>	<p><b>ID.IM-P1:</b> Systems/products/services that process <a href="#">data</a> are inventoried.</p>
		<p><b>ID.IM-P2:</b> Owners or operators (e.g., the organization or third parties such as service providers, partners, customers, and developers) and their roles with respect to the systems/products/services and components (e.g., internal or external) that process data are inventoried.</p>
		<p><b>ID.IM-P3:</b> Categories of <a href="#">individuals</a> (e.g., customers, employees or prospective employees, consumers) whose data are being processed are inventoried.</p>
		<p><b>ID.IM-P4:</b> <a href="#">Data actions</a> of the systems/products/services are inventoried.</p>
		<p><b>ID.IM-P5:</b> The purposes for the data actions are inventoried.</p>
		<p><b>ID.IM-P6:</b> <a href="#">Data elements</a> within the data actions are inventoried.</p>
		<p><b>ID.IM-P7:</b> The data processing environment is identified (e.g., geographic location, internal, cloud, third parties).</p>
		<p><b>ID.IM-P8:</b> Data processing is mapped, illustrating the data actions and associated data elements for systems/products/services, including components; roles of the component owners/operators; and interactions of individuals or third parties with the systems/products/services.</p>
	<p><b>Business Environment (ID.BE-P):</b> The organization’s mission, objectives, stakeholders, and activities are understood and prioritized; this information is used to inform privacy roles, responsibilities, and <a href="#">risk management</a> decisions.</p>	<p><b>ID.BE-P1:</b> The organization’s role(s) in the <a href="#">data processing ecosystem</a> are identified, communicated, and understood.</p>
		<p><b>ID.BE-P2:</b> The organizational mission is identified, communicated, and understood and informs privacy risk management.</p>
		<p><b>ID.BE-P3:</b> Systems/products/services that support organizational priorities are identified and key requirements communicated and understood.</p>

Function	Category	Subcategory
<p><b>Function</b></p>	<p><b>Category</b></p>	<p><b>ID.BE-P4:</b> Data processing ecosystem parties (e.g., service providers, customers, partners, product manufacturers, application developers) are identified and prioritized.</p>
		<p><b>ID.BE-P5:</b> Objectives, capabilities, and services that stakeholders depend on or expect from the organization are identified, communicated, and understood.</p>
		<p><b>ID.BE-P6:</b> Outcomes, capabilities, and services that the organization depends on are identified, communicated, and understood.</p>
	<p><b>Risk Assessment (ID.RA-P):</b> The organization understands the <a href="#">privacy risks</a> to <a href="#">individuals</a> and how such privacy risks may create follow-on impacts on organizational operations, including mission, functions, other <a href="#">risk management</a> priorities (e.g., compliance, financial), reputation, workforce, and culture.</p>	<p><b>ID.RA-P1:</b> Contextual factors related to the systems/products/services and the <a href="#">data actions</a> are identified (e.g., individuals’ demographics and privacy interests or perceptions, <a href="#">data</a> sensitivity and/or types, visibility of <a href="#">data processing</a> to individuals and third parties).</p>
		<p><b>ID.RA-P2:</b> <i>This Subcategory related to artificial intelligence systems is WITHDRAWN to keep PF 1.1 Core outcomes technology-neutral.</i></p>
		<p><b>ID.RA-P3:</b> Potential <a href="#">problematic data actions</a> and associated problems are identified.</p>
		<p><b>ID.RA-P4:</b> Problematic data actions, likelihoods, and impacts are used to determine and prioritize risk.</p>
		<p><b>ID.RA-P5:</b> Risk responses are identified, prioritized, and implemented.</p>
		<p><b>ID.RA-P6:</b> Data processing ecosystem parties (e.g., service providers, customers, partners, product manufacturers, application developers) are assessed using a privacy risk assessment process.</p>
		<p><b>Data Processing Ecosystem Risk Management (ID.DE-P):</b> <i>Category is moved to Govern-P and renamed GV.DE-P.</i></p>
	<p><b>ID.DE-P2:</b> <i>Moved to ID.BE-P4 and ID.RA-P6</i></p>	
	<p><b>ID.DE-P3:</b> <i>Moved to GV.DE-P2</i></p>	
	<p><b>ID.DE-P4:</b> <i>Moved to GV.DE-P3</i></p>	
<p><b>ID.DE-P5:</b> <i>Moved to GV.DE-P4</i></p>		
<p><b>GOVERN-P (GV-P):</b> Develop and implement the organizational</p>	<p><b>Governance Policies, Processes, and Procedures (GV.PO-P):</b> The policies, processes, and procedures to manage and monitor the organization’s regulatory,</p>	<p><b>GV.PO-P1:</b> Organizational privacy values and policies (e.g., conditions on data processing such as data uses or retention periods, individuals’ prerogatives with respect to data processing) are established, communicated, and enforced.</p>

Function	Category	Subcategory
governance structure to enable an ongoing understanding of the organization’s risk management priorities that are informed by privacy risk.	legal, <a href="#">risk</a> , environmental, and operational requirements are understood and inform the management of <a href="#">privacy risk</a> .	<b>GV.PO-P2:</b> Processes to instill organizational privacy values within system/product/service development and operations are established and in place.
	<b>GV.PO-P3:</b> <i>Moved to GV.RR-P2</i>	
	<b>GV.PO-P4:</b> <i>Moved to GV.RR-P3</i>	
	<b>GV.PO-P5:</b> Legal, regulatory, and contractual requirements regarding privacy are understood and managed.	
	<b>GV.PO-P6:</b> Governance and enterprise risk management policies, processes, and procedures address privacy risks.	
	<b>GV.PO-P7:</b> Privacy procedures are included in human resources practices (e.g., deprovisioning, personnel screening).	
	<b>Risk Management Strategy (GV.RM-P):</b> The organization’s priorities, constraints, <a href="#">risk tolerance</a> and appetite, and assumptions are established and used to support operational <a href="#">risk</a> decisions.	<b>GV.RM-P1:</b> <a href="#">Risk management</a> objectives and processes are established, managed, and agreed to by organizational stakeholders.
	<b>GV.RM-P2:</b> The organization’s risk appetite and risk tolerance are determined and communicated and are informed by the organization’s role(s) in the <a href="#">data processing ecosystem</a> .	
	<b>GV.RM-P3:</b> <i>Moved to GV.RM-P2</i>	
	<b>GV.RM-P4:</b> Strategic direction that describes appropriate risk response options is established and communicated.	
	<b>GV.RM-P5:</b> Lines of communication across the organization are established for privacy risks, including risks from data processing ecosystem parties.	
	<b>GV.RM-P6:</b> A standardized method for calculating, documenting, categorizing, and prioritizing privacy risks is established and communicated.	
	<b>GV.RM-P7:</b> Strategic opportunities (i.e., positive risks) are characterized and included in organizational privacy risk discussions.	

Function	Category	Subcategory
<p><b>Function</b></p>	<p><b>Oversight (GV.OV-P):</b> Results of organization-wide privacy risk management activities and performance are used to inform, improve, and adjust the risk management strategy.</p>	<p><b>GV.OV-P1:</b> Privacy risk management strategy outcomes are reviewed to inform and adjust strategy and direction.</p>
		<p><b>GV.OV-P2:</b> The privacy risk management strategy is reviewed and adjusted to ensure coverage of organizational requirements and risks.</p>
		<p><b>GV.OV-P3:</b> Organizational privacy risk management performance is measured and reviewed to confirm and adjust strategic direction.</p>
	<p><b>Roles, Responsibilities, and Authorities (GV.RR-P):</b> Privacy roles, responsibilities, and authorities to foster accountability, performance assessment, and continuous improvement are established and communicated.</p>	<p><b>GV.RR-P1:</b> Organizational leadership is responsible and accountable for privacy risk and fosters a culture that is risk-aware, ethical, and continually improving.</p>
		<p><b>GV.RR-P2:</b> Roles and responsibilities for the workforce are established with respect to privacy.</p>
		<p><b>GV.RR-P3:</b> Privacy roles and responsibilities are coordinated and aligned with external stakeholders (e.g., service providers, customers, partners).</p>
		<p><b>GV.RR-P4:</b> Adequate resources are allocated commensurate with privacy risk strategy, roles and responsibilities, and policies.</p>
	<p><b>Data Processing Ecosystem Risk Management (GV.DE-P):</b> The organization’s priorities, constraints, risk tolerance, and assumptions are established and used to support processes and risk decisions associated with data processing ecosystem risk management.</p>	<p><b>GV.DE-P1:</b> Data processing ecosystem risk management strategy, objectives, policies, and processes are established and agreed to by organizational stakeholders.</p>
		<p><b>GV.DE-P2:</b> Contracts with data processing ecosystem parties are used to implement appropriate measures designed to meet the objectives of an organization’s privacy program.</p>
		<p><b>GV.DE-P3:</b> Interoperability frameworks or similar multi-party approaches are used to manage data processing ecosystem privacy risks.</p>
		<p><b>GV.DE-P4:</b> Data processing ecosystem parties are routinely assessed using audits, test results, or other forms of evaluations to confirm they are meeting their contractual, interoperability framework, or other obligations.</p>

Function	Category	Subcategory
		<b>GV.DE-P5:</b> Data processing ecosystem risk management is integrated into privacy and enterprise risk management, risk assessment, and improvement processes.
	<b>Awareness and Training (GV.AT-P):</b> The organization’s personnel are provided with privacy awareness and training so that they can perform their privacy-related tasks	<b>GV.AT-P1:</b> Personnel are provided with awareness and training so that they possess the knowledge and skills to perform privacy-related tasks.
		<b>GV.AT-P2:</b> Individuals in specialized roles are provided with awareness and training so that they possess the knowledge and skills to perform privacy-related tasks.
		<b>GV.AT-P3:</b> <i>Moved to GV.AT-P2</i>
		<b>GV.AT-P4:</b> <i>Moved to GV.AT-P2</i>
	<b>Monitoring and Review (GV.MT-P):</b> The policies, processes, and procedures for ongoing review of the organization’s privacy posture are understood and inform the management of <a href="#">privacy risk</a> .	<b>GV.MT-P1:</b> Privacy risk is re-evaluated on an ongoing basis and as key factors, including the organization’s business environment (e.g., introduction of new technologies), governance (e.g., legal obligations, <a href="#">risk tolerance</a> ), <a href="#">data processing</a> , and systems/products/services change.
		<b>GV.MT-P2:</b> Privacy values, policies, and training are reviewed and any updates are communicated.
		<b>GV.MT-P3:</b> Policies, processes, and procedures for assessing compliance with legal requirements and privacy policies are established and in place.
		<b>GV.MT-P4:</b> Policies, processes, and procedures for communicating progress on managing privacy risks are established and in place.
		<b>GV.MT-P5:</b> Policies, processes, and procedures are established and in place to receive, analyze, and respond to <a href="#">problematic data actions</a> disclosed to the organization from internal and external sources (e.g., internal discovery, privacy researchers, professional events).
<b>GV.MT-P6:</b> Policies, processes, and procedures incorporate lessons learned from problematic data actions.		

Function	Category	Subcategory
		<p><b>GV.MT-P7:</b> Policies, processes, and procedures for receiving, tracking, and responding to complaints, concerns, and questions from <a href="#">individuals</a> about organizational privacy practices are established and in place.</p>
<p><b>CONTROL-P (CT-P):</b> Develop and implement appropriate activities to enable organizations or individuals to manage data with sufficient granularity to manage privacy risks.</p>	<p><b>Data Processing Policies, Processes, and Procedures (CT.PO-P):</b> Policies, processes, and procedures are maintained and used to manage <a href="#">data processing</a> (e.g., purpose, scope, roles and responsibilities in the <a href="#">data processing ecosystem</a>, and management commitment) consistent with the organization’s <a href="#">risk</a> strategy to protect <a href="#">individuals’</a> privacy.</p>	<p><b>CT.PO-P1:</b> Policies, processes, and procedures for authorizing data processing (e.g., organizational decisions, individual consent), revoking authorizations, and maintaining authorizations are established and in place.</p>
		<p><b>CT.PO-P2:</b> Policies, processes, and procedures for enabling <a href="#">data</a> review, transfer, sharing or disclosure, alteration, and deletion are established and in place (e.g., to maintain data quality, manage data retention).</p>
		<p><b>CT.PO-P3:</b> Policies, processes, and procedures for enabling individuals’ data processing preferences and requests are established and in place.</p>
		<p><b>CT.PO-P4:</b> A data life cycle to manage data is aligned and implemented with the system development life cycle to manage systems.</p>
	<p><b>Data Processing Management (CT.DM-P):</b> <a href="#">Data</a> are managed consistent with the organization’s <a href="#">risk</a> strategy to protect <a href="#">individuals’</a> privacy, increase <a href="#">manageability</a>, and enable the implementation of privacy principles (e.g., individual participation, data quality, data minimization).</p>	<p><b>CT.DM-P1:</b> <a href="#">Data elements</a> can be accessed for review.</p>
		<p><b>CT.DM-P2:</b> Data elements can be accessed for transmission or disclosure.</p>
		<p><b>CT.DM-P3:</b> Data elements can be accessed for alteration.</p>
		<p><b>CT.DM-P4:</b> Data elements can be accessed for deletion.</p>
		<p><b>CT.DM-P5:</b> Data are destroyed according to policy.</p>
		<p><b>CT.DM-P6:</b> Data are transmitted using standardized formats.</p>
		<p><b>CT.DM-P7:</b> Mechanisms for transmitting <a href="#">processing</a> permissions are established and in place.</p>
<p><b>CT.DM-P8:</b> Mechanisms for transmitting data elements in accordance with processing permissions are established and in place.</p> <p><b>CT.DM-P9:</b> Log records are determined, documented, implemented, and reviewed in accordance with policy and incorporating the principle of data minimization.</p>		

Function	Category	Subcategory
	<p><b>Disassociated Processing (CT.DP-P):</b> <a href="#">Data processing</a> solutions increase <a href="#">disassociability</a> consistent with the organization’s <a href="#">risk</a> strategy to protect <a href="#">individuals’</a> privacy and enable implementation of privacy principles (e.g., data minimization).</p>	<p><b>CT.DM-P10:</b> Technical measures implemented to manage data processing are tested and assessed.</p>
		<p><b>CT.DM-P11:</b> Stakeholder privacy preferences are included in algorithmic design objectives and outputs are evaluated against these preferences.</p>
		<p><b>CT.DP-P1:</b> <a href="#">Data</a> are processed to limit observability, linkability, and singling out (e.g., <a href="#">data actions</a> take place on local devices, privacy-preserving cryptography).</p>
		<p><b>CT.DP-P2:</b> Data are processed to limit the identification of individuals (e.g., de-identification privacy techniques, tokenization).</p>
		<p><b>CT.DP-P3:</b> Data are processed to limit the formulation of inferences about individuals’ behavior or activities (e.g., data processing is decentralized, distributed architectures).</p>
		<p><b>CT.DP-P4:</b> System or device configurations permit selective collection or disclosure of <a href="#">data elements</a>.</p>
		<p><b>CT.DP-P5:</b> <a href="#">Attribute values</a> are substituted with <a href="#">derived attribute values</a> (e.g., providing an "age older than" statement rather than the actual age).</p>
<p><b>COMMUNICATE-P (CM-P):</b> Develop and implement appropriate activities to enable organizations and individuals to have a reliable understanding and engage in a dialogue about how data are processed and associated privacy risks.</p>	<p><b>Communication Policies, Processes, and Procedures (CM.PO-P):</b> Policies, processes, and procedures are maintained and used to increase transparency of the organization’s <a href="#">data processing</a> practices (e.g., purpose, scope, roles and responsibilities in the <a href="#">data processing ecosystem</a>, and management commitment) and associated <a href="#">privacy risks</a>.</p>	<p><b>CM.PO-P1:</b> Transparency policies, processes, and procedures for communicating data processing purposes, practices, and associated privacy risks are established and in place.</p>
	<p><b>CM.PO-P2:</b> Roles and responsibilities (e.g., public relations) for communicating data processing purposes, practices, and associated privacy risks are established.</p>	
	<p><b>CM.AW-P1:</b> Mechanisms (e.g., notices, internal or public reports) for communicating data processing purposes, practices, associated privacy risks, and options for enabling individuals’ data processing preferences and requests are established and in place.</p>	
	<p><b>CM.AW-P2:</b> Mechanisms for obtaining feedback from individuals (e.g., surveys or focus groups) about data processing and associated privacy risks are established and in place.</p>	

Function	Category	Subcategory
	organization’s <a href="#">risk</a> strategy to protect individuals’ privacy.	<b>CM.AW-P3:</b> System/product/service design enables data processing visibility.
		<b>CM.AW-P4:</b> Records of <a href="#">data</a> disclosures and sharing are maintained and can be accessed for review or transmission/disclosure.
		<b>CM.AW-P5:</b> Data corrections or deletions can be communicated to individuals or organizations (e.g., data sources) in the <a href="#">data processing ecosystem</a> .
		<b>CM.AW-P6:</b> Data <a href="#">provenance</a> and <a href="#">lineage</a> are maintained and can be accessed for review or transmission/disclosure.
		<b>CM.AW-P7:</b> Impacted individuals and organizations are notified about a <a href="#">privacy breach</a> or <a href="#">event</a> .
		<b>CM.AW-P8:</b> Individuals are provided with mitigation mechanisms (e.g., credit monitoring, consent withdrawal, data alteration or deletion) to address impacts of <a href="#">problematic data actions</a> .
<b>PROTECT-P (PR-P):</b> Develop and implement appropriate data processing safeguards.	<b>Data Protection Policies, Processes, and Procedures (PR.PO-P):</b> Security and privacy policies (e.g., purpose, scope, roles and responsibilities in the <a href="#">data processing ecosystem</a> , and management commitment), processes, and procedures are maintained and used to manage the protection of <a href="#">data</a> .	<b>PR.PO-P1:</b> <i>Moved to PR.PS-P1</i>
		<b>PR.PO-P2:</b> <i>Moved to PR.PS-P1</i>
		<b>PR.PO-P3:</b> <i>Moved to PR.DS-P10</i>
		<b>PR.PO-P4:</b> <i>Moved to PR.IR-P2</i>
		<b>PR.PO-P5:</b> Improvements to data protection policies, processes, and procedures are identified (e.g., from evaluations, security tests and exercises, execution of policies, processes, and procedures), communicated, and implemented.
		<b>PR.PO-P6:</b> <i>Moved to PR.PO-P5</i>
		<b>PR.PO-P7:</b> Incident response and recovery plans are established, communicated, maintained, and improved.
		<b>PR.PO-P8:</b> <i>Moved to PR.PO-P7</i>
		<b>PR.PO-P9:</b> <i>Moved to GV.PO-P7</i>
		<b>PR.PO-P10:</b> <i>Moved to PR.PS-P2</i>
<b>Identity Management, Authentication, and Access Control (PR.AA-P):</b> Access to <a href="#">data</a> , devices, and systems is limited to authorized individuals, services, and	<b>PR.AA-P1:</b> Identities and credentials for authorized individuals, services, and hardware are managed by the organization.	
	<b>PR.AA-P2:</b> Identities are proofed and bound to credentials based on the context of interactions.	

Function	Category	Subcategory
	hardware, and is managed commensurate with the assessed risk of unauthorized access.	<b>PR.AA-P3:</b> Individuals, services, and hardware are authenticated commensurate with risk.
		<b>PR.AA-P4:</b> Identity assertions are protected, conveyed, and verified.
		<b>PR.AA-P5:</b> Access permissions, entitlements, and authorizations are defined in a policy, managed, enforced, and reviewed, and incorporate the principles of least privilege and separation of duties.
		<b>PR.AA-P6:</b> Physical access to data and devices is managed, monitored, and enforced commensurate with risk.
	<b>Identity Management, Authentication, and Access Control (PR.AC-P):</b> <i>Category is withdrawn; Subcategories moved to PR.AA-P and PR.IR-P</i>	<b>PR.AC-P1:</b> <i>Moved to PR.AA-P1</i>
	<b>PR.AC-P2:</b> <i>Moved to PR.AA-P6</i>	
	<b>PR.AC-P3:</b> <i>Moved to PR.AA-P3, PR.AA-P5, and PR.IR-P1</i>	
	<b>PR.AC-P4:</b> <i>Moved to PR.AA-P5</i>	
	<b>PR.AC-P5:</b> <i>Moved to PR.IR-P1</i>	
	<b>PR.AC-P6:</b> <i>Moved to PR.AA-P2</i>	
	<b>Data Security (PR.DS-P):</b> <u>Data</u> are managed consistent with the organization’s <u>risk</u> strategy to protect <u>individuals’</u> privacy and maintain data <u>confidentiality</u> , <u>integrity</u> , and <u>availability</u> .	<b>PR.DS-P1:</b> The confidentiality, integrity, and availability of data-at-rest are protected.
		<b>PR.DS-P2:</b> The confidentiality, integrity, and availability of data-in-transit are protected.
		<b>PR.DS-P3:</b> Systems/products/services and associated data are managed throughout their life cycle.
		<b>PR.DS-P4:</b> <i>Moved to PR.IR-P4</i>
		<b>PR.DS-P5:</b> <i>Moved to PR.DS-P1, P2, and P9</i>
		<b>PR.DS-P6:</b> <i>Moved to PR.DS-P8</i>
		<b>PR.DS-P7:</b> <i>Moved to PR.IR-P1</i>
		<b>PR.DS-P8:</b> The authenticity and integrity of hardware and software are assessed prior to acquisition and use.
		<b>PR.DS-P9:</b> The confidentiality, integrity, and availability of data-in-use are protected.

Function	Category	Subcategory	
	<b>Platform Security (PR.PS-P):</b> The hardware, software (e.g., firmware, operating systems, applications), and services of physical and virtual platforms and associated data are managed consistent with the organization’s risk strategy to protect individuals’ privacy and maintain data confidentiality, integrity, and availability.	<b>PR.DS-P10:</b> Backups of data are created, protected, maintained, and tested.	
		<b>PR.PS-P1:</b> Configuration management practices are established and applied.	
		<b>PR.PS-P2:</b> Software is maintained, replaced, and removed commensurate with risk.	
		<b>PR.PS-P3:</b> Hardware is maintained, replaced, and removed commensurate with risk.	
		<b>PR.PS-P4:</b> Installation and execution of unauthorized software are prevented.	
		<b>Technology Infrastructure Resilience (PR.IR-P):</b> Security architectures are managed with the organization’s risk strategy to protect individuals’ privacy and maintain data confidentiality, integrity, and availability.	<b>PR.IR-P1:</b> Networks and environments are protected from unauthorized logical access and usage.
			<b>PR.IR-P2:</b> The organization’s technology assets, including associated data, are protected from environmental threats.
			<b>PR.IR-P3:</b> Mechanisms are implemented to achieve resilience requirements in normal and adverse situations.
			<b>PR.IR-P4:</b> Adequate resource capacity to ensure availability is maintained.
		<b>Maintenance (PR.MA-P):</b> <i>Category is withdrawn; Subcategories moved to PR.PS-P</i>	<b>PR.MA-P1:</b> <i>Moved to PR.PS-P2 and P3</i>
	<b>PR.MA-P2:</b> <i>Moved to PR.PS-P2 and P3</i>		
	<b>Protective Technology (PR.PT-P):</b> <i>Category is withdrawn; Subcategories moved to PR.AA-P, PR.PS-P, and PR.IR-P</i>	<b>PR.PT-P1:</b> <i>Moved to PR.PS-P1</i>	
		<b>PR.PT-P2:</b> <i>Moved to PR.PS-P1</i>	
		<b>PR.PT-P3:</b> <i>Moved to PR.AA-P6 and PR.IR-P1</i>	
		<b>PR.PT-P4:</b> <i>Moved to PR.IR-P3</i>	

736

## 738 **Appendix B. Glossary**

739 This appendix defines selected terms used for the purposes of this publication.

### 740 **Attribute Value (NIST SP 800-63-4 2pd [9])**

741 A complete statement that asserts an identity attribute of a subscriber, independent of format. For example, for  
742 the attribute “birthday,” a value could be “12/1/1980” or “December 1, 1980.”

### 743 **Availability (44 U.S.C. [14])**

744 Ensuring timely and reliable access to and use of information.

### 745 **Category**

746 The subdivision of a Function into groups of privacy outcomes closely tied to programmatic needs and particular  
747 activities.

### 748 **Communicate-P (Function)**

749 Develop and implement appropriate activities to enable organizations and individuals to have a reliable  
750 understanding and engage in a dialogue about how data are processed and associated privacy risks.

### 751 **Confidentiality (44 U.S.C. [14])**

752 Preserving authorized restrictions on access and disclosure, including means for protecting personal privacy and  
753 proprietary information.

### 754 **Control-P (Function)**

755 Develop and implement appropriate activities to enable organizations or individuals to manage data with sufficient  
756 granularity to manage privacy risks.

### 757 **Core**

758 A set of privacy protection activities and outcomes. The Framework Core comprises three elements: Functions,  
759 Categories, and Subcategories.

### 760 **Cybersecurity Incident (OMB 17-12 [10])**

761 An occurrence that (1) actually or imminently jeopardizes, without lawful authority, the integrity, confidentiality,  
762 or availability of information or an information system; or (2) constitutes a violation or imminent threat of violation  
763 of law, security policies, security procedures, or acceptable use policies.

### 764 **Data**

765 A representation of information, including digital and non-digital formats.

### 766 **Data Action (Adapted from NIST IR 8062 [4])**

767 A system/product/service data life cycle operation, including, but not limited to collection, retention, logging,  
768 generation, transformation, use, disclosure, sharing, transmission, and disposal.

### 769 **Data Element**

770 The smallest named item of data that conveys meaningful information.

### 771 **Data Processing (Adapted from NIST IR 8062 [4])**

772 The collective set of data actions (i.e., the complete data life cycle, including, but not limited to collection,  
773 retention, logging, generation, transformation, use, disclosure, sharing, transmission, and disposal).

### 774 **Data Processing Ecosystem**

775 The complex and interconnected relationships among entities involved in creating or deploying systems, products,  
776 or services or any components that process data.

777 **Derived Attribute Value (NIST SP 800-63-4 2pd [9])**

778 A statement that asserts a limited identity *attribute* of a subscriber without containing the attribute value from  
779 which it is derived, independent of format. For example, instead of requesting the attribute “birthday,” a derived  
780 value could be “older than 18”. Instead of requesting the attribute for “physical address,” a derived value could be  
781 “currently residing in this district.” Previously referred to as “attribute reference.”

782 **Disassociability (Adapted from NIST IR 8062 [4])**

783 Enabling the processing of data or events without association to individuals or devices beyond the operational  
784 requirements of the system.

785 **Function**

786 A component of the Core that provides the highest level of structure for organizing basic privacy activities into  
787 Categories and Subcategories.

788 **Govern-P (Function)**

789 Develop and implement the organizational governance structure to enable an ongoing understanding of the  
790 organization’s risk management priorities that are informed by privacy risk.

791 **Identify-P (Function)**

792 Develop the organizational understanding to manage privacy risk for individuals arising from data processing.

793 **Implementation Tier**

794 Provides a point of reference on how an organization views privacy risk and whether it has sufficient processes and  
795 resources in place to manage that risk.

796 **Individual**

797 A single person or a group of persons, including at a societal level.

798 **Integrity (44 U.S.C. [14])**

799 Guarding against improper information modification or destruction, and includes ensuring information  
800 nonrepudiation and authenticity.

801 **Lineage**

802 The history of processing of a data element, which may include point-to-point data flows and the data actions  
803 performed upon the data element.

804 **Manageability (Adapted from NIST IR 8062 [4])**

805 Providing the capability for granular administration of data, including alteration, deletion, and selective disclosure.

806 **Metadata (Adapted from NIST SP 800-53 [11])**

807 Information describing the characteristics of data.

808 This may include, for example, structural metadata describing data structures (i.e., data format, syntax, semantics)  
809 and descriptive metadata describing data contents.

810 **Predictability (Adapted from NIST IR 8062 [4])**

811 Enabling reliable assumptions by individuals, owners, and operators about data and their processing by a system,  
812 product, or service.

813 **Privacy Breach (Adapted from OMB M-17-12 [10])**

814 The loss of control, compromise, unauthorized disclosure, unauthorized acquisition, or any similar occurrence  
815 where (1) a person other than an authorized user accesses or potentially accesses data or (2) an authorized user  
816 accesses data for an other than authorized purpose.

- 817 **Privacy Control (Adapted from NIST SP 800-37 [8])**  
818 The administrative, technical, and physical safeguards employed within an organization to satisfy privacy  
819 requirements.
- 820 **Privacy Event**  
821 The occurrence or potential occurrence of problematic data actions.
- 822 **Privacy Requirement**  
823 A specification for system/product/service functionality to meet stakeholders' desired privacy outcomes.
- 824 **Privacy Risk**  
825 The likelihood that individuals will experience problems resulting from data processing, and the impact should they  
826 occur.
- 827 **Privacy Risk Assessment**  
828 A privacy risk management sub-process for identifying and evaluating specific privacy risks.
- 829 **Privacy Risk Management**  
830 A cross-organizational set of processes for identifying, assessing, and responding to privacy risks.
- 831 **Problematic Data Action (Adapted from NIST IR 8062 [4])**  
832 A data action that could cause an adverse effect for individuals.
- 833 **Processing**  
834 See *Data Processing*.
- 835 **Profile**  
836 A selection of specific Functions, Categories, and Subcategories from the Core that an organization has prioritized  
837 to help it manage privacy risk.
- 838 **Protect-P (Function)**  
839 Develop and implement appropriate data processing safeguards.
- 840 **Provenance (Adapted from NIST IR 8112 [12])**  
841 Metadata pertaining to the origination or source of specified data.
- 842 **Risk (NIST SP 800-30 [13])**  
843 A measure of the extent to which an entity is threatened by a potential circumstance or event, and typically a  
844 function of: (i) the adverse impacts that would arise if the circumstance or event occurs; and (ii) the likelihood of  
845 occurrence.
- 846 **Risk Management**  
847 The process of identifying, assessing, and responding to risk.
- 848 **Risk Tolerance (NIST SP 800-39 [7])**  
849 The level of risk or degree of uncertainty that is acceptable to organizations.
- 850 **Subcategory**  
851 The further divisions of a Category into specific outcomes of technical and/or management activities.

851 **Appendix C. Acronyms**

852 This appendix defines selected acronyms used in the publication.

853 **IEC**

854 International Electrotechnical Commission

855 **IR**

856 Interagency or Internal Report

857 **ISO**

858 International Organization for Standardization

859 **IT**

860 Information Technology

861 **NIST**

862 National Institute of Standards and Technology

863 **OASIS**

864 Organization for the Advancement of Structured Information Standards

865 **OECD**

866 Organisation for Economic Co-operation and Development

867 **OMB**

868 Office of Management and Budget

869 **PMRM**

870 Privacy Management Reference Model and Methodology

871 **PRAM**

872 Privacy Risk Assessment Methodology

873 **RFC**

874 Request for Comment

875 **RFI**

876 Request for Information

877 **SDLC**

878 System Development Life Cycle

879 **SP**

880 Special Publication

## 881 **Appendix D. Privacy Risk Management Practices**

882 Section 1.2 introduces a number of considerations around privacy risk management, including  
883 the relationship between cybersecurity and privacy risk, the relationship between AI and  
884 privacy risk, and the role of privacy risk assessment. This appendix considers some of the key  
885 practices that contribute to successful privacy risk management, including organizing  
886 preparatory resources, determining privacy capabilities, defining privacy requirements,  
887 conducting privacy risk assessments, creating privacy requirements traceability, and monitoring  
888 for changing privacy risks. Category and Subcategory references are included to facilitate use of  
889 the Core to support these practices; these references appear in parentheses.

### 890 **Organizing Preparatory Resources**

891 The appropriate resources facilitate informed decision-making about privacy risks at all levels of  
892 an organization. As a practical matter, the responsibility for the development of various  
893 resources may belong to different components of an organization. Therefore, a component of  
894 an organization depending on certain resources may find that they either do not exist, or may  
895 not sufficiently address privacy. In these circumstances, the dependent component can  
896 consider the purpose of the resource and either seek the information through other sources or  
897 make the best decision it can with the available information. In short, good resources are  
898 helpful, but any deficiencies should not prevent organizational components from making the  
899 best risk decisions they can within their capabilities.

900 The following resources, while not exhaustive, build a foundation for better decision-making.

#### 901 **• Risk management role assignments (GV.RR-P)**

902 Establishing and enabling cross-organizational understanding of who is accountable and  
903 who has responsibility for privacy risk management as well as other risk management  
904 tasks in an organization supports better coordination and accountability for decision-  
905 making. In addition, a broad range of perspectives can improve the process of  
906 identifying, assessing, and responding to privacy risks. A diverse and cross-functional  
907 team can help to identify a more comprehensive range of risks to individuals' privacy,  
908 and to select a wider set of mitigations. Determining which roles to include in the risk  
909 management discussions depends on organizational context and makeup, although  
910 collaboration among an organization's programs that implicate privacy risk (e.g., privacy,  
911 cybersecurity, AI) will be important. If one individual is being assigned to multiple roles,  
912 managing potential conflicts of interest should be considered.

#### 913 **• Enterprise risk management strategy (GV.RM-P)**

914 An organization's enterprise risk management strategy helps to align an organization's  
915 mission and values with organizational risk tolerance, assumptions, constraints, and  
916 priorities. Limitations on resources to achieve mission or business objectives and to  
917 manage a broad portfolio of risks will likely require trade-offs. Enabling personnel  
918 involved in the privacy risk management process to better understand an organization's

919 strategic direction, risk tolerance, and lines of communication should help to guide  
920 decisions about how to allocate resources and improve decisions around risk response.

921 • **Key stakeholders** (GV.RR-P3, GV.DE-P)

922 Privacy stakeholders are those who have an interest or concern in the privacy outcomes  
923 of the system, product, or service. For example, legal concerns likely focus on whether  
924 the system, product, or service is operating in a way that would cause an organization to  
925 be out of compliance with privacy laws or regulations or its business agreements.

926 Business owners that want to maximize usage may be concerned about loss of trust in  
927 the system, product, or service due to poor privacy. Individuals whose data are being  
928 processed or who are interacting with the system, product, or service will be interested  
929 in not experiencing problems or adverse consequences. Understanding the stakeholders  
930 and the types of privacy outcomes they are interested in will facilitate  
931 system/product/service design that appropriately addresses stakeholders' needs.

932 • **Organizational-level privacy requirements** (GV.PO-P)

933 Organizational-level privacy requirements are a means of expressing the legal  
934 obligations, privacy values, and policies to which an organization intends to adhere.  
935 Understanding these requirements is key to ensuring that the system/product/service  
936 design complies with its obligations. Organizational-level privacy requirements may be  
937 derived from a variety of sources, including:

- 938 ○ Legal environment (e.g., laws, regulations, contracts);
- 939 ○ Organizational policies or cultural values;
- 940 ○ Relevant standards; and
- 941 ○ Privacy principles.

942 • **System/product/service design artifacts** (ID.BE-P3)

943 Design artifacts may take many forms such as system design architectures or data flow  
944 diagrams. These artifacts help an organization determine how its systems, products, and  
945 services will operate. Therefore, they can help privacy programs understand how  
946 systems, products, and services need to function so that controls or measures that help  
947 to mitigate privacy risk can be selected and implemented in ways that maintain  
948 functionality while protecting privacy.

949 • **Data maps** (ID.IM-P)

950 Data maps illustrate data processing and individuals' interactions with systems,  
951 products, and services. A data map shows the data processing environment and includes  
952 the components through which data are being processed or with which individuals are  
953 interacting, the owners or operators of the components, and discrete data actions and  
954 the specific data elements being processed. Data maps can be illustrated in different  
955 ways, and the level of detail may vary based on an organization's needs. A data map can  
956 be overlaid on existing system/product/service design artifacts for convenience and

957 ease of communication between organizational components. As discussed below, a data  
958 map is an important artifact in privacy risk assessment.

### 959 Determining Privacy Capabilities

960 Privacy capabilities can be used to describe the system, product, or service property or feature  
961 that achieves the desired privacy outcome (e.g., “the service enables data minimization”). The  
962 security objectives confidentiality, integrity, and availability along with security requirements  
963 are used to inform the security capabilities for a system, product, or service. As set forth in  
964 **Table 3**, an additional set of privacy engineering objectives can support the determination of  
965 privacy capabilities. An organization may also use the privacy engineering objectives as a high-  
966 level prioritization tool. Systems, products, or services that are low in predictability,  
967 manageability, or disassociability may be a signal of increased privacy risk, and therefore merit  
968 a more comprehensive privacy risk assessment.

969 In determining privacy capabilities, an organization may consider which of the privacy  
970 engineering and security objectives are most important with respect to its mission or business  
971 needs, risk tolerance, and organizational-level privacy requirements (see Organizing  
972 Preparatory Resources above). Not all of the objectives may be equally important, or trade-offs  
973 may be necessary among them. Although the privacy capabilities inform the privacy risk  
974 assessment by supporting risk prioritization decisions, the privacy capabilities may also be  
975 informed by the risk assessment and adjusted to support the management of specific privacy  
976 risks or address changes in the environment, including design changes to the system, product,  
977 or service.

978

**Table 3: Privacy Engineering and Security Objectives<sup>21</sup>**

	<b>Objective</b>	<b>Definition</b>	<b>Principal Related Functions from the Privacy Framework Core</b>
<b>Privacy Engineering Objectives</b>	Predictability	Enabling reliable assumptions by individuals, owners, and operators about data and their processing by a system	Identify-P, Govern-P, Control-P, Communicate-P, Protect-P
	Manageability	Providing the capability for granular administration of data, including collection, alteration, deletion, and selective disclosure	Identify-P, Govern-P, Control-P
	Disassociability	Enabling the processing of data or events without association to individuals or devices beyond the operational requirements of the system	Identify-P, Govern-P, Control-P
<b>Security Objectives</b>	Confidentiality	Preserving authorized restrictions on information access and disclosure, including means for protecting personal privacy and proprietary information	Identify-P, Govern-P, Protect-P
	Integrity	Guarding against improper information modification or destruction; includes ensuring information non-repudiation and authenticity	Identify-P, Govern-P, Protect-P
	Availability	Ensuring timely and reliable access to and use of information	Identify-P, Govern-P, Protect-P

979 **Defining Privacy Requirements**

980 Privacy requirements specify the way a system, product, or service needs to function to meet  
 981 stakeholders’ desired privacy outcomes (e.g., “the application is configured to allow users to  
 982 select specific data elements”). To define privacy requirements, consider organizational-level  
 983 privacy requirements (see Organizing Preparatory Resources above) and the outputs of a  
 984 privacy risk assessment. This process helps an organization to answer two questions: 1) What  
 985 can a system, product, or service do with data processing and interactions with individuals? 2)  
 986 What should it do? Then an organization can allocate resources to design a system, product, or  
 987 service in a way that achieves the defined requirements. Ultimately, defining privacy  
 988 requirements can lead to the development of systems, products, and services that are more  
 989 mindful of individuals’ privacy, and are based on informed risk decisions.

990 **Conducting Privacy Risk Assessments**

991 Conducting a privacy risk assessment helps an organization to identify privacy risks engendered  
 992 by the system, product, or service and prioritize them to be able to make informed decisions  
 993 about how to respond to the risks consistent with the organization’s overall risk management

---

<sup>21</sup> The privacy engineering objectives are adapted from NIST IR 8062 [4]. The security objectives are from NIST SP 800-37, Rev. 2 [8].

994 strategy (ID.RA-P, GV.RM-P). Methodologies for conducting privacy risk assessments may vary,  
995 but organizations should consider the following characteristics:<sup>22</sup>

996 • **Risk model** (ID.RA-P, GV.MT-P1)

997 Risk models define the risk factors to be assessed and the relationships among those  
998 factors.<sup>23</sup> If an organization is not using a pre-defined risk model, an organization should  
999 clearly define which risk factors it will be assessing and the relationships among these  
1000 factors. Although cybersecurity has a  
1001 widely used risk model based on the  
1002 risk factors of threats, vulnerabilities,  
1003 likelihood, and impact, there is not  
1004 one commonly accepted privacy risk  
1005 model. NIST has developed a privacy risk model to calculate risk based on the likelihood  
1006 of a problematic data action multiplied by the impact of a problematic data action; each  
1007 of the three risk factors are explained below.

- 1008 ○ A problematic data action is any action a system takes to process data that could  
1009 result in a problem for individuals. Organizations consider the type of problems  
1010 that are relevant to the population of individuals. Problems can take any form  
1011 and may consider the experience of individuals.<sup>24</sup>
- 1012 ○ Likelihood is defined as a contextual analysis that a data action is likely to create  
1013 a problem for a representative set of individuals. Context can include  
1014 organizational factors (e.g., geographic location, the public perception about  
1015 participating organizations with respect to privacy), system factors (e.g., the  
1016 nature and history of individuals' interactions with the system, visibility of data  
1017 processing to individuals and third parties), or individual factors (e.g., individuals'  
1018 demographics, privacy interests or perceptions, data sensitivity).<sup>25</sup> A data map  
1019 can help with this contextual analysis (see Organizing Preparatory Resources).
- 1020 ○ Impact is an analysis of the costs should the problem occur. As noted in section  
1021 1.2, organizations do not experience these problems directly. Moreover,  
1022 individuals' experiences may be subjective. Thus, impact may be difficult to  
1023 assess accurately. Organizations should consider the best means of internalizing  
1024 impact to individuals in order to appropriately prioritize and respond to privacy  
1025 risks.<sup>26</sup>

---

<sup>22</sup> NIST has developed a Privacy Risk Assessment Methodology (PRAM) that can help organizations identify, assess, and respond to privacy risks. It is comprised of a set of worksheets available at [2].  
<sup>23</sup> See NIST SP 800-30, Rev. 1, *Guide for Conducting Risk Assessments* [13] at p. 8.  
<sup>24</sup> As part of its PRAM, NIST has created an illustrative catalog of problematic data actions and problems for consideration [2]. Other organizations may have created additional problem sets, or may refer to them as adverse consequences or harms.  
<sup>25</sup> See NIST PRAM for more information about contextual factors. Id. at Worksheet 2.  
<sup>26</sup> The NIST PRAM uses organizational costs such as non-compliance costs, direct business costs, reputational costs, and internal culture costs as drivers for considering how to assess individual impact. Id. at Worksheet 3, Impact Tab.

- 1026 • **Assessment approach**
- 1027 The assessment approach is the mechanism by which identified risks are prioritized.
- 1028 Assessment approaches can be categorized as quantitative, semi-quantitative, or
- 1029 qualitative.<sup>27 28</sup>
- 1030 • **Prioritizing risks (ID.RA-P4)**
- 1031 Given the applicable limits of an organization’s resources, organizations prioritize the
- 1032 risks to facilitate communication about how to respond.<sup>29</sup>
- 1033 • **Responding to risks (ID.RA-P5)**
- 1034 As described in section 1.2.2, response approaches include mitigation, transfer/sharing,
- 1035 avoidance, or acceptance.<sup>30</sup>

### 1036 Creating Privacy Requirements Traceability

1037 Once an organization has determined which risks to mitigate, it can refine the privacy  
1038 requirements and then select and implement controls (i.e., technical, physical, and/or policy  
1039 safeguards) to meet the requirements [8]. An organization may use a variety of sources to  
1040 select controls, such as NIST SP 800-53, *Security and Privacy Controls for Information Systems  
1041 and Organizations [11]*. After implementation, an organization iteratively assesses the controls  
1042 for their effectiveness in meeting the privacy requirements and managing privacy risk. In this  
1043 way, an organization creates traceability between the controls and the privacy requirements,  
1044 and demonstrates accountability between its systems, products, and services and its  
1045 organizational privacy goals.

### 1046 Monitoring Change

1047 Privacy risk management is not a static process. An organization monitors how changes in its  
1048 business environment—including new laws and regulations and emerging technologies—and  
1049 corresponding changes to its systems, products, and services may be affecting privacy risk, and  
1050 iteratively uses the practices in this appendix to adjust accordingly (GV.MT-P1).

### 1051 Supporting Effective Oversight

1052 Organization-wide privacy risk management outcomes, activities, and performance are used to  
1053 inform, improve, and adjust the organization’s overall risk management strategy. An  
1054 organization reviews its privacy risk management strategy outcomes and measures its privacy  
1055 risk management performance to adjust its strategic direction and ensure privacy risk  
1056 management sufficiently addresses organizational requirements and risks (GV.OV-P).

---

<sup>27</sup> See NIST SP 800-30, Rev. 1, *Guide for Conducting Risk Assessments* at [13] p. 14.

<sup>28</sup> The NIST PRAM uses a semi-quantitative approach based on a scale of 1-10.

<sup>29</sup> The NIST PRAM provides various prioritization representations, including a heat map. See [2] Worksheet 3.

<sup>30</sup> The NIST PRAM provides a process for responding to prioritized privacy risks. See [2] at Worksheet 4.

## 1057 **Appendix E. Tiers Definitions**

1058 The four Tiers summarized below are each defined with four elements:

### 1059 Tier 1: Partial

- 1060 • **Privacy Risk Management Process** – Organizational privacy risk management practices  
1061 are not formalized, and risk is managed in an ad hoc and sometimes reactive manner.  
1062 Prioritization of privacy activities may not be directly informed by organizational risk  
1063 management priorities, privacy risk assessments, or mission or business objectives.
- 1064 • **Integrated Privacy Risk Management Program** – There is limited awareness of privacy  
1065 risk at the organizational level. The organization implements privacy risk management  
1066 on an irregular, case-by-case basis due to varied experience or information gained from  
1067 outside sources. The organization may not have processes that enable the sharing of  
1068 information about data processing and resulting privacy risks within the organization.
- 1069 • **Data Processing Ecosystem Relationships** – There is limited understanding of an  
1070 organization’s role(s) in the larger ecosystem with respect to other entities (e.g., buyers,  
1071 suppliers, service providers, business associates, partners). The organization does not  
1072 have processes for identifying how privacy risks may proliferate throughout the  
1073 ecosystem or for communicating privacy risks or requirements to other entities in the  
1074 ecosystem.
- 1075 • **Workforce** – Some personnel may have a limited understanding of privacy risks or  
1076 privacy risk management processes, but have no specific privacy responsibilities. If  
1077 available, privacy training is ad hoc and the content is not kept current with best  
1078 practices.

### 1079 Tier 2: Risk Informed

- 1080 • **Privacy Risk Management Process** – Risk management practices are approved by  
1081 management but may not be established as organization-wide policy. Prioritization of  
1082 privacy activities is directly informed by organizational risk management priorities,  
1083 privacy risk assessments, or mission or business objectives.
- 1084 • **Integrated Privacy Risk Management Program** – There is an awareness of privacy risk at  
1085 the organizational level, but an organization-wide approach to managing privacy risk has  
1086 not been established. Information about data processing and resulting privacy risks is  
1087 shared within the organization on an informal basis. Consideration of privacy in  
1088 organizational objectives and programs may occur at some but not all levels of the  
1089 organization. Privacy risk assessment occurs, but is not typically repeatable or  
1090 reoccurring.
- 1091 • **Data Processing Ecosystem Relationships** – There is some understanding of an  
1092 organization’s role(s) in the larger ecosystem with respect to other entities (e.g., buyers,  
1093 suppliers, service providers, business associates, partners). The organization is aware of  
1094 the privacy ecosystem risks associated with the products and services it provides and  
1095 uses, but does not act consistently or formally upon those risks.

- 1096       • **Workforce** – There are personnel with specific privacy responsibilities, but they may  
1097       have non-privacy responsibilities as well. Privacy training is conducted regularly for  
1098       privacy personnel, although there is no consistent process for updates on best practices.

1099 Tier 3: Repeatable

- 1100       • **Privacy Risk Management Process** – The organization’s risk management practices are  
1101       formally approved and expressed as policy. Organizational privacy practices are  
1102       regularly updated based on the application of risk management processes to changes in  
1103       mission or business objectives and a changing risk, policy, and technology landscape.
- 1104       • **Integrated Privacy Risk Management Program** – There is an organization-wide  
1105       approach to manage privacy risk. Risk-informed policies, processes, and procedures are  
1106       defined, implemented as intended, and reviewed. Consistent methods are in place to  
1107       respond effectively to changes in risk. The organization consistently and accurately  
1108       monitors privacy risk. Senior privacy and non-privacy executives communicate regularly  
1109       regarding privacy risk. Senior executives ensure consideration of privacy through all lines  
1110       of operation in the organization.
- 1111       • **Data Processing Ecosystem Relationships** – The organization understands its role(s),  
1112       dependencies, and dependents in the larger ecosystem and may contribute to the  
1113       community’s broader understanding of risks. The organization is aware of the privacy  
1114       ecosystem risks associated with the products and services it provides and it uses.  
1115       Additionally, it usually acts formally upon those risks, including mechanisms such as  
1116       written agreements to communicate privacy requirements, governance structures, and  
1117       policy implementation and monitoring.
- 1118       • **Workforce** – Dedicated privacy personnel possess the knowledge and skills to perform  
1119       their appointed roles and responsibilities. There is regular, up-to-date privacy training  
1120       for all personnel.

1121 Tier 4: Adaptive

- 1122       • **Privacy Risk Management Process** – The organization adapts its privacy practices based  
1123       on lessons learned from privacy events, and identification of new privacy risks. Through  
1124       a process of continuous improvement incorporating advanced privacy technologies and  
1125       practices, the organization actively adapts to a changing policy and technology  
1126       landscape and responds in a timely and effective manner to evolving privacy risks.
- 1127       • **Integrated Privacy Risk Management Program** – There is an organization-wide  
1128       approach to managing privacy risk that uses risk-informed policies, processes, and  
1129       procedures to address problematic data actions. The relationship between privacy risk  
1130       and organizational objectives is clearly understood and considered when making  
1131       decisions. Senior executives monitor privacy risk in the same context as cybersecurity  
1132       risk, financial risk, and other organizational risks. The organizational budget is based on  
1133       an understanding of the current and predicted risk environment and risk tolerance.  
1134       Business units implement executive vision and analyze system-level risks in the context  
1135       of the organizational risk tolerances. Privacy risk management is part of the

- 1136 organizational culture and evolves from lessons learned and continuous awareness of  
1137 data processing and resulting privacy risks. The organization can quickly and efficiently  
1138 account for changes to business/mission objectives in how risk is approached and  
1139 communicated.
- 1140 • **Data Processing Ecosystem Relationships** – The organization understands its role(s),  
1141 dependencies, and dependents in the larger ecosystem and contributes to the  
1142 community’s broader understanding of risks. The organization uses real-time or near-  
1143 real-time information to understand and consistently act upon privacy ecosystem risks  
1144 associated with the products and services it provides and it uses. Additionally, it  
1145 communicates proactively, using formal (e.g., agreements) and informal mechanisms to  
1146 develop and maintain strong ecosystem relationships.
  - 1147 • **Workforce** – The organization has specialized privacy skillsets throughout the  
1148 organizational structure; personnel with diverse perspectives contribute to the  
1149 management of privacy risks. There is regular, up-to-date, specialized privacy training  
1150 for all personnel. Personnel at all levels understand the organizational privacy values  
1151 and their role in maintaining them.
